Additive effects of nicotine and high-fat diet on hepatic steatosis and hepatocellular apoptosis in mice: Involvement of caspase 2 and inducible nitric oxide synthase-mediated intrinsic pathway signaling

Rasheed Ivey, B.S., M.S.
Post-baccalaureate student- Charles Drew University
rivmd83@yahoo.com

Rasheed Ivey, M.S. is a research assistant working with Dr. Theodore Friedman, Dr. Amiya Sinha-Hikim, and Dr. Amira Brown, at Charles R. Drew University of Medicine and Science, Department of Internal Medicine and Endocrinology. His primary basic science research interests are the effects of high fat diet and drugs of abuse on metabolic syndrome and the endocrine system. His current projects include investigating the effects of high fat diet and nicotine consumption on hepatic steatosis as well as a new pilot project investigating high fat diet and nicotine consumption on cancer proliferation. Rasheed served as co-author for a recently published article in the Journal of Endocrinology, titled, “Additive effects of nicotine and high-fat diet on hepatic steatosis and hepatocellular apoptosis in mice: Involvement of caspase 2 and inducible nitric oxide synthase-mediated intrinsic pathway signaling.” This project will be presented at the ENDO conference in San Francisco, California, June 14-17, as a Featured Poster and Podium Presentation.
